

**Why this is the corpus.** An attacker's call exists only after an agent has read an injection and acted on it. Fabricating it plants a shortcut no held-out split can detect; compromising a live agent and recording what it emits is the only construction in which malicious and benign calls come from the same process.

The matched control answers the objection that the agent would have called that tool anyway: 0.285 % against 95.07 %. The two benign arms keep the comparison honest: without the two-step arm, “did untrusted text precede this call?” would separate the classes on its own.
